Freight Traffic Control 2050: transforming the energy demands of FTC 2050 last-mile urban freight through collaborative logistics **Follow @FTC2050**

Are people key to enabling collaborative logistics?

Oliver Bates, Bran Knowles, Adrian Friday Lancaster University, UK {o.bates,b.h.knowles1,a.friday}@lancaster.ac.uk

Enabling collaborative and low-carbon freight in cities, the vision...

 Understanding parcel generation and deliveries

RCEL

2

N. O

- Understanding the spatial and temporal elements of the street
- Enabling shared loads across couriers and hauliers
- Lowering carbon through reducing the demand on infrastructure
- Helping redesign of the urban environment

B Tower of Lor London Royal Albert H Freight transport makes up 16% of all road vehicle activity in our cities, with lorries and vans performing 30% of their total activity in urban areas. Traffic congestion in central London is set to worsen by 60% by 2030.

Manifests vs Parking Locations

Understanding the role of people in last-mile logistics

If you ignore people you miss out on:

- The "drivers bible" tacit and local knowledge effecting decisions made on the job
- A Parcel manifests only tell you the destinations, not how the drivers get there
- Driver churn and turnover leads to lost knowledge and inexperienced drivers on rounds
- Driver's end up walking with several parcels and not parking at each destination address

We have observed that driver performance varies, effecting time taken and parcels delivered.

Variations in choices made by the driver leads to variations in the time spent delivering each parcel (3 - 4.8 minutes per item delivered).

Experienced drivers have better local knowledge:

- Make their own loading, routing and parking optimisations
- Better understanding of roads, congestion and alternative routes than technology
- Understanding of stopping places and parking restrictions that isn't always present in datasets
- Personal relationships with building security, traffic wardens and shop owners

Tacit knowledge and **personal relationships** give the best performing drivers the biggest the edge when it comes to delivery time and total parcels delivered.

Designing for low-carbon, collaborative, last-mile logistics should consider:

SLOWING GROWTH IN DEMAND

TIME How can technology can stem or slow, not accelerate demand and carbon footprint

Transport for London

The importance of parking location and walking

The role of tacit knowledge of the roads and human relationships in design
